

NAAN MUDHALVAN PROJECT PORTFOLIO | PHASE 1 OF 8

Phase 1: Project Overview, Requirement Analysis & Planning

Project: Auto Ticket Classification using Flow Designer | **Platform:** ServiceNow | **Domain:** IT Service Management (ITSM) Automation

1. Executive Summary & Problem Statement

Problem Statement: The educational institution's School IT Helpdesk receives scores of support requests every day from faculty members, administrative staff, and students. These incoming incidents range across diverse domains—campus Wi-Fi connectivity blackouts, smart projector hardware breakdowns in lecture halls, forgot password/account lockouts on student portals, and workstation slowdowns.

Historically, the IT desk team manually examined each submitted ticket, diagnosed the issue type, assigned proper Category and Subcategory attributes, and routed tickets to technicians. This manual intervention resulted in:

- **Substantial Latency:** Critical classrooms sat idle waiting 30-90 minutes for categorization.
- **Human Inconsistency:** Misclassified tickets routed to wrong teams, increasing resolution hops.
- **Zero Immediate Feedback:** Callers remained unaware if their issue was acknowledged.

2. Project Objectives & Success Criteria

- **Automated Ingestion & Classification:** Instantly inspect short description keywords on ticket creation and auto-populate Category and Subcategory fields.
- **Eliminate Manual Triaging:** Remove human classification overhead for over 80% of standard campus incidents.
- **Zero-Script Scalability:** Implement a maintainable, robust, and audit-friendly solution completely within ServiceNow Flow Designer (No-Code approach).
- **Instant Caller Acknowledgement:** Trigger automated transactional notifications to callers immediately upon ticket generation.

3. Detailed Functional & Non-Functional Requirements

Requirement Category	Description	ServiceNow Component
Automatic Categorization	Identify keywords (e.g., 'WiFi', 'Projector', 'Password', 'Slow') and auto-set category & subcategory without manual click.	Flow Designer Trigger & Logic Blocks
Hierarchical Integrity		Data Dictionary Dependent Field Mapping

Requirement Category	Description	ServiceNow Component
	Strict field dependency enforcement: Subcategory values must dynamically filter strictly based on selected Category.	
Communication Loop	Instant notification email sent to caller's registered email with ticket number and recorded details.	Flow Designer Action: Send Email
Data Traceability	All development packaged into an isolated Update Set for seamless audit and deployment governance.	System Update Sets (Local Update Set)

4. High-Level Architecture & Lifecycle Flow Diagram

5. Activity Breakdown & Configuration Plan

Activity 1.1: Business Environment & Use Case Mapping

Establish exact operational parameters for the School IT Helpdesk. Classify common tickets into 4 core tracks: Network, Hardware, Access, and Performance.

Activity 1.2: Development Governance & Update Set Creation

All customization must be tracked within a dedicated ServiceNow Local Update Set to ensure transportability between Dev, Test, and Production instances.

Navigation: All Menus → System Update Sets → Local Update Sets → Click 'New'

- Name: Project Update Set
- Application: Global
- State: In progress
- Action: Click 'Submit and Make Current'

Outcome: Every subsequent dictionary modification, form design alteration, and flow creation is automatically recorded into this update set container.
