

NAAN MUDHALVAN PROJECT PORTFOLIO | PHASE 5 OF 8

Phase 5: Notification Services & Automated Communication Setup

Project: Auto Ticket Classification using Flow Designer | **Service:** ServiceNow Notification Engine & Inbound/Outbound Dispatch

1. Objective of Integrated Communication

A persistent grievance among campus stakeholders was the lack of visibility after raising a technical issue. Phase 5 configures an integrated notification pipeline directly into the Flow Designer automation, guaranteeing that the instant a record is classified, an official acknowledgement is transmitted to the user's institutional email address.

2. Flow Action: Send Email Configuration

Action Specification

Parameter	Configuration Value	Description
Action Type	Send Email (Core ServiceNow Action)	Executes without requiring custom SMTP script wrappers.
Target Recipient (To)	Trigger → Incident Workflow Record → Caller → Email	Dynamically resolves caller email through sys_user relation using the Data Pill Picker.
Subject Line	Your IT Support Ticket [Number] has been logged & categorized	Includes dynamic Incident Number data pill.
Email Format	HTML Rich Text	Professional branded layout for clear readability on mobile and web.

3. Email Content Template Structure

Dear [Trigger->Incident Workflow->Caller->First Name],

Thank you for reaching out to the School IT Helpdesk. Your incident has been registered and automatically routed for resolution.

Incident Details:

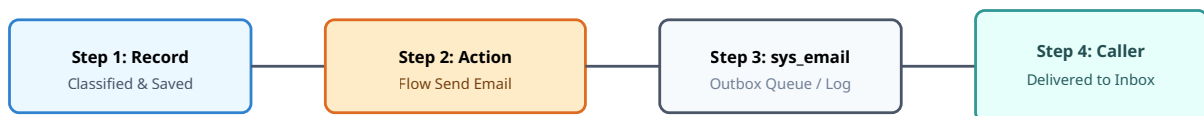

- Ticket Number: [Trigger->Number]
- Issue Summary: [Trigger->Short Description]
- Assigned Category: [Updated->Category]

- Assigned Subcategory: **[Updated->Subcategory]**
 - Current Status: New
-

Our technical support personnel have been alerted and will update this record upon taking assignment.

Sincerely,
School IT Helpdesk Automation Services

4. Communication Flow Architecture

5. Flow Activation Governance

Once the **Send Email** action block is tethered to the execution path, click the **Activate** button in the top-right header of Flow Designer. This compiles the flow into an active engine trigger and binds it to database transactions across all user sessions.
